

Managing your seismic project

Terrex Seismic has more than 30 years experience in planning and undertaking seismic surveys in Australia and overseas, and is well-equipped to project manage a wide range of operations.

We ensure the successful completion of all land seismic surveys from seismic survey planning through to the completion of data acquisition in accordance with best industry practice.

Our ongoing commitment to protecting the host environment has resulted in a portfolio of successful seismic surveys and positive engagement with stakeholders.

Our highly experienced team is equipped to project manage operations from the pre-planning stages until completion and reporting, encompassing approvals and access as well as survey and data management and post-survey restoration and monitoring of information. Terrex Seismic has the experience and established systems to ensure the management of a range of crucial factors are taken into consideration in each stage of the project.

We do this by applying project management methodologies to ensure all aspects of survey activities are delivered with high performance in terms of technical, quality, health, safety, environment, timing and cost. This includes:

Contractor management	We work closely with contractors involved in the process, including land clearing contractors and data interpretation contractors.
Land access	We assist clients to gain land access and environmental approvals.
EMPs	We undertake project management of ground work that meets strict environmental controls and checks, and we ensure compliance with environmental legislation across Australia. This includes the development and negotiation of Environmental Management Plans (EMPs). We also assist, prepare, submit and implement project safety and security plans.
Stakeholder management	We can liaise with key stakeholders including government departments, native title representation bodies, industry representatives, seismic and environmental contractors and landowners and NGOs on behalf of clients.
Indigenous relations	We undertake project management of ground work to ensure compliance with relative Native Title, cultural clearances and anthropological requirements.
HSEC compliance	We ensure all seismic activities comply with the relevant government legislation, our HSE management systems and our client's HSE management system.
On-ground management	We provide on-the-ground management of all field operations from line clearing to rehabilitation.
Local engagement	We engage with local communities, including local recruitment and sourcing local supplies where possible.
Post-seismic reviews	We undertake reviews post-seismic to generate understanding of environmental impacts and stakeholder relationships, including native title, landowners and community members.
Project management - general	We can assist clients with project scheduling, cost tracking, forward planning of resource requirements, logistics, and reporting.
